

**Amendments to the Abstract:**

Please replace the Abstract on page 22 with the following new Abstract:

In one embodiment, a support pillow is constructed of an inflated pillow body having an interior that is adapted to be filled with a fluid to inflate the pillow body. The pillow body also has a top side, a bottom side, and a plurality of walls disposed in the interior that connect the top side to the bottom side to facilitate flattening of the top and bottom sides when the pillow body is inflated. The pillow body also has a medial region and first and second arms extending from the medial region. The arms and medial region cooperate to define an open well. Further, the walls are spaced apart by about 3 inches to about 10 inches and have a height in the range from about 2 inches to about 8 inches.
